

SecureDocs

A large number of companies rely solely on preprinted security paper to protect their high value documents. Though preprinted security paper does a good job of securing the base document, it does not address the security of personal data that is added to the document at the point of print.

By not securing personal data, companies are leaving themselves vulnerable to unauthorized modifications, forgery or photocopying. TROY SecureDocs helps companies by adding another layer of protection to their documents. By adding personalized security features to each print file before it is routed to the printer, companies can now add in a layer of security beyond preprinted stock, helping to create unique and secure documents.

SecureDocs Benefits

- Supports multiple custom security profiles for individual documents.
- Works across desktop, midrange, and production printing environments.
- Allows companies who utilize preprinted security paper and forms to add another layer of protection to their documents.
- Eliminates dependency on expensive preprinted security paper and forms.
- Reduces time and labor spent on chain of custody processes and managing security stock paper.
- Streamlines document security print processes.
- Grows with business document security needs.

TROY MicroPrint

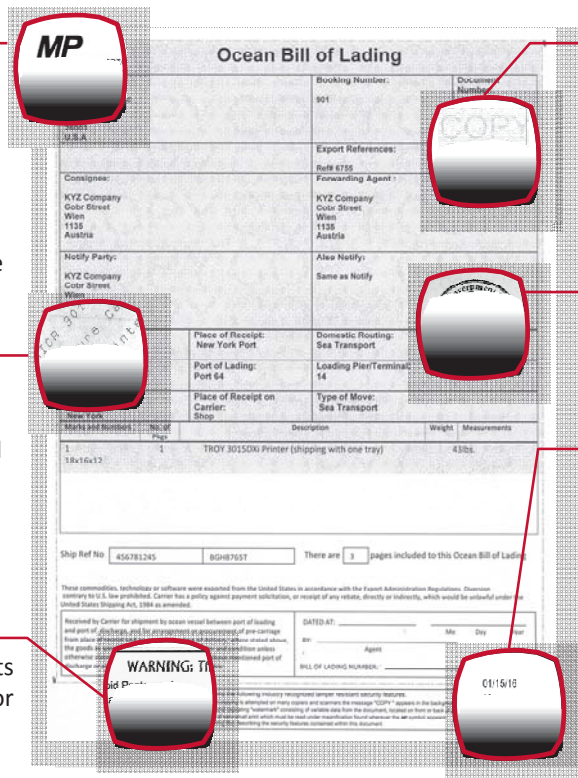

Provides a secondary authentication method by using a very small font, which is readable when viewed at five times magnification or greater. TROY MicroPrint will appear illegible when copied and can be set up to display static text, variable text, or as part of the PrintTrace Feature.

TROYMark™

A unique watermark of user defined or variable data, printed diagonally across the front or back of each printed document. With multiple unique data fields, this intelligent anti-tampering technology helps to easily verify document authenticity.

Text Box

Displays static text to provide documents with user-generated content intended for the reader such as a warning box.

TROY Copy Evident Pantograph

Used to prevent unauthorized copying, the pantograph is a hidden feature that appears across a photocopied or scanned version of a securely printed document in the form of a word such as "VOID", "Illegal" or "Copy".

Image Elements

Incorporates unique icons, logos, seals, watermarks, and custom images to create personalized documents.

PrintTrace

Used as a tool to track print output by listing out the specific meta data desired to appear on a document such as, the document name, print date, document owner, printer name, server name, or computer name.
